### **How It Works**

In order to understand what the Clear Sky air ionizer does, it helps to know what air ions are.

Air ions are molecules with an electrical charge.

They're invisible molecules that float around in the atmosphere. Negative ions are molecules that have gained an electron; positive ions are those that have lost an electron.

An air ionizer is a device that releases negative ions into the air. The negative ions attach to tiny particles, like those in tobacco smoke.

This gives the particles an electrical charge, causing them to clump together and land on surfaces like:

- walls
- ceilings
- floors
- tabletops
- curtains

- carpets and rugs
- metal collector plates in the device

Once the particles have landed on something, they can be cleaned up.
